

Blue rubber bleb nevus disease

To the Editor,

I have read with interest Dr. Gawrych et al.'s paper entitled "Coexistence of splenic hemangioma and vascular malformation of the lower extremity in a child: a case report" in a recent issue of the Journal (2012; 54: 436-439).

Although no image of the left leg was included, from the description of the lesions, I would consider the diagnosis of blue rubber bleb nevus disease in this patient, in whom hemangiomas of internal organs would also be expected.

Unfortunately, the splenic image was in black/white; nevertheless, the hemangioma lesions seem to be consistent with blue rubber bleb disease. I wish the authors would consider this diagnosis in their patient.
